How to change your Kerberos Password

Document Version: September 2010

Linux

If the Kerberos-Client is installed you can use it to change your Password.

Press [Alt] + [F2] , then a Command Prompt pops up.

Type „Konsole“ and press [enter] or the [Ausführen] button.

Switch to the „Konsole“-Windows and type „kpasswd“

Windows 7

If the Kerberos-Client for Windows is installed you can use it to change your Password.

Because the Kerberos-Client uses the Windows login to get credentials you have also to change your Windows Password.
